

# React Repo for FSD-C-WE-T-B23

---

## Steps to initialize the project as a Git Repo

1. **Initialize Git:** Open your terminal and navigate to the project directory. Run:

```
git init
```

2. Visit [GitHub](#) and create a new repository. Do not initialize it with a README, .gitignore, or license.

3. **Add Remote Origin:** After creating the repository, copy the remote URL and run:

```
git remote add origin <your-repo-url>
```

4. **Rename the default branch:** If your Git version is 2.28 or later, you can set the default branch name to **main** by running:

```
git branch -M main
```

5. **Add Files:** Add all files to the staging area:

```
git add .
```

6. **Commit Changes:** Commit the changes with a message:

```
git commit -m "Initial commit"
```

7. **Push to GitHub:** Finally, push your changes to the remote repository:

```
git push -u origin main
```
